

Desk Study Report

Project Name: Ilkeston Road, Sowbrook Lane

Location: Ilkeston, Derbyshire

Client: Wulf Asset Management Ltd

Project ID: JN1643

Report Date: 28 January 2022

Report Issue: 1

SUMMARY

The site, which extends to 10.3 hectares, comprises a grassed parcel of land to the south of Ilkeston in Derbyshire. It is proposed to develop the site with residential housing, although layouts are still to be finalised.

Geological records indicate the site to be underlain by Pennine Middle Coal Measures (Mudstone), with the Wingfield Flags present in the south and Alluvium present in the far north. Worked Ground and Made ground are mapped close to the site boundaries. The superficial and bedrock units are Secondary A Aquifers, although the site is not located within a SPZ.

A desk study was carried out and indicates that the site has a history of coal and ironstone mining prior to a more recent agricultural use. Some ponds were present on site, which appear to have been backfilled.

The overall contamination risk from the site is considered to be low to moderate, subject to how the site was backfilled. If the backfill comprised re-worked natural soil, for example, then the contaminating risk is likely to be low. A Phase II intrusive investigation is necessary, which will primarily focus on the geotechnical issues relating to the site, although an assessment of the contamination risk will also be carried out, from both the soil and ground gases.

This desk study report has been prepared for the sole internal use and reliance of Wulf Asset management Ltd and their appointed Engineers. This report shall not be relied upon or transferred to any other parties without the express written authorisation of Southern Testing Laboratories Ltd. If an unauthorised third party comes into possession of this report they rely on it at their peril and the authors owe them no duty of care and skill.

The findings and opinions conveyed via this investigation report are based on information obtained from a variety of sources as detailed within this report, and which Southern Testing Laboratories Ltd. believes are reliable. Nevertheless, Southern Testing Laboratories Ltd. cannot and does not guarantee the authenticity or reliability of the information it has obtained from others.

A INTRODUCTION

1 Authority

Our authority for carrying out this work is contained in a signed Consultant Appointment for the provision of the Phase I Desk Study Report.

2 Location

The site is located to the south of Ilkeston, in Derbyshire, bound by Ilkeston Road and Sowbrook Lane. The approximate National Grid Reference of the site is SK 46400 39340. The site location is indicated on Figure 1 within Appendix A.

3 Proposed Construction

It is proposed to develop the 10.3 ha site with housing, although final layouts are still to be finalised.

For the purposes of the contamination risk assessment, the proposed development land use is classified as Residential with CLEA Model Ref [1] / C4SL Report Ref [2].

The gas sensitivity of the proposed development is therefore rated as High CIRIA C665 Ref [3].

4 Object

This is a Phase 1 Desk Study and Walkover investigation.

The object of this investigation was to review the historic and cotemporary use of the site and surrounding area, and assess the likely nature and extent of soil, groundwater and soil gas contamination, based on desk study information only. No intrusive investigation has been carried out to date.

A Coal Mining Risk Assessment was produced for this site by BWB Consulting in November 2021.

5 Scope

This report presents our desk study findings, and our interpretation of these data.

The desk study investigation has been completed with reference to BS 5930 Ref [4] and BS 10175 Ref [5].

The findings and opinions conveyed via this investigation report are based on information obtained from a variety of sources as detailed within this report, and which Southern Testing Laboratories Ltd. believes are reliable. Nevertheless, Southern Testing Laboratories Ltd. cannot and does not guarantee the authenticity or reliability of the information it has obtained from others.

The report was conducted and this report has been prepared for the sole internal use and reliance of Wulf Asset Management Ltd and their appointed Engineers. This report shall not be relied upon or transferred to any other parties without the express written authorisation of Southern Testing Laboratories Ltd. If an unauthorised third party comes into possession of this report they rely on it at their peril and the authors owe them no duty of care and skill.

The recommendations contained in this report may not be appropriate to alternative development schemes.

Detailed information on the proposed development, such as detailed final layout, loadings and serviceability limits was not provided. Accordingly, where geotechnical design advice is provided it is on the prescriptive basis allowed for by Eurocode 7: employing conventional and conservative design rules.

B DESK STUDY AND WALKOVER SURVEY

A desk study has been carried out. Reference has been made to the following information sources.

- Online Geological Maps Ref [6] & Ref [7]
- Online Hydrogeological Maps Ref [8]
- Aerial Photographs
- Historical Ordnance Survey Maps
- Environmental Databases
- BGS Online Historical Borehole Records Ref [9]
- Search on Local Authority Planning Portal for planning history
- Environment Agency / Gov.UK Website Flood Risk Ref [11]
- UK Radon Ref [12] and BRE Radon Ref [13]
- Google Earth (for old aerial photographs)

The environmental databases search report compiled for this desk study contains site-specific environmental data drawn from data sets that comprise publicly available information together with data from third parties, some of which is under review. Accordingly, Southern Testing Laboratories Limited does not warrant its accuracy, reliability or completeness.

The full report is included in Appendix C and D, a summary of the salient features is included in the following sections of this report.

6 Geology

The British Geological Survey Map No 125 (Derby), indicates that the site geology consists of the Pennine Middle Coal Measures (Mudstone), with the Wingfield Flags present in the south and alluvium present along northern boundary. Made and Worked Ground are mapped close to the site boundaries.

6.1 Alluvium

Alluvium is a general term for clay, silty, sand and gravel. It is the unconsolidated detrital material deposited by a river, stream or other body of running water as sorted or semi-sorted sediment in the bed of the stream, or on its floodplain or delta, or as a cone or fan at the base of a mountain slope. Normally soft to firm consolidated, compressible silty clay, but can contain layers of silt, sand, peat and basal gravel. A stronger, desiccated surface zone may be present.

6.2 Pennine Middle Coal Measures

The Pennine Middle Coal Measures comprise interbedded grey mudstone, siltstone, pale grey sandstone and commonly coal seams, with a bed of mudstone containing marine fossils at the base, and several such marine fossil-bearing mudstones in the upper half of the unit.

6.3 Wingfield Flags

The Wingfield Flags comprise fine-grained sandstone with siltstone interbeds.

7 Historical Borehole Records

A search of previous exploratory hole records both from the online British Geological Survey database [9] and Southern Testing in-house records, reveals a few archive boreholes were drilled within the local vicinity of the site; however, access to these records was restricted.

Geological Hazards and Mining Activities 8

Data from various sources relating to potential geological hazards at the site are summarized below. The Hazard Potentials listed for the BGS data are as presented in the Envirocheck report, derived from various generic BGS sources, which are not considered as site-specific. It is important that this information is considered in context of the actual site topography, ground conditions encountered during future investigation, and development proposals.

Data Source	Hazard	Hazard Potential to Site	Remarks
BGS	Potential for Collapsible Ground Stability Hazard	Very Low	However, see section 15 below
	Potential for Compressible Ground Stability Hazard	Moderate	Alluvium deposits and material within the infilled ponds are likely to represent the compressible ground risk.
	Potential for Ground Dissolution Stability Hazard	No Hazard	
	Potential for Landslide Ground Stability Hazard	Very Low	
	Potential for Running Sand Ground Stability Hazard	Low	
	Potential for Swelling or Shrinkage Clay Ground Stability Hazard	Very Low	Possibly higher, depending on the nature of the alluvial deposits.
	BGS recorded mineral site	Yes	Kirk Hallam Ironstone pits recorded on-site and in the surrounding area (to the east)
	Coal Mining Affected Areas	Yes	See section 15 below.
ARUP [Ref [14]]	Mining Instability	Yes	Inconclusive Coal Mining.
CCS [Ref [15]] KURG [Ref [16]]	Underground Openings	-	None recorded within database
PBA	Natural & Mining Cavities	-	None recorded within database

9 Radon Risk

With reference to the Envirocheck report, UK Radon Ref [12] and BRE Radon Ref [13] The site is in an intermediate probability radon area (1 to 3% of homes are estimated to be at or above the action level). Guidance: No radon protective measures are necessary in the construction of new dwellings or extensions.

10 Hydrology and Hydrogeology

Data from the Environment Agency and other information relating to controlled waters is summarised below.

Data		Remarks	Possible Hazard to/from Site (Y/ N)
Aquifer Designation	Superficial Deposits	Secondary A Aquifer – Only within Alluvium.	Y
Bedrock		Secondary A Aquifer.	Y
Groundwater V	ulnerability	Medium vulnerability – Secondary Aquifer.	Y
Abstractions Surface		225m East: Saint Gobain Pipelines Plc.	N
	Water	Metal: process water and non-evaporative cooling for iron works (from Nut Brook)	N

Data		Remarks	Possible Hazard to/from Site (Y/ N)	
	Groundwater	None recorded within 1km of the site.	N	
Source Protecti	on Zones	The site is not located within a Source Protection Zone.	N	
Surface Watercourses		The nearest surface water course is the Nutbrook Canal, which immediately bounds the northern edge of the site. There is a drain on the eastern side of the site which runs into the canal and numerous other drains to the north of the canal – all appear unnamed.	Y	
Groundwater Flood Risk		Most of the site lies within an area where limited potential for groundwater flooding to occur. Potential for groundwater flooding to occur at surface within the northwest.	Y	
Surface Water Flood Risk		Most of the site is shown to be outside a risk of surface water flooding. Zones of High risk (30 year return) from surface water flooding are mapped on the northern and western boundaries alongside a small zone in the southeast.	Y	
Fluvial Flood Ri	sk	The northern boundary of the site is shown to be at risk of extreme flooding from rivers without defences (Zone 2)	Y	
Discharge Consents		23m to the east: Stanton Bonna Concrete Limited. Trade Discharge, cooling water & site drainage (discharge into canals).	N	
		214m East: Saint Gobain Pipelines Plc. Trade Discharge, cooling water, trade effluent & site drainage	N	
		218m East: Stanton Plc. Trade Discharge, process water into Nutbrook	N	

^{*} These sections are provided for information only, this report does not constitute a formal flood risk assessment and specialist advice should be sought in relation to potential flooding issues.

11 Historical Ordnance Survey Maps

Copy extracts of historical Ordnance Survey plans dating from 1881 to 2021 were obtained and are presented in Appendix H. A summary of the salient features is presented below.

1881 (1:2,500) – The earliest map shows the land as a series of five fields enclosures, with the northern two shown as rough pasture. Ilkeston Road and Sowbrook Lane are present on the boundaries, as today, although not named at this time. A small row of terrace houses were present off the south-east corner of the site. A small building is marked within the west of the site, with a small pond shown in the far western corner, a short distance to the north of the building. A second pond is located within the north-east of the site. The remainder of the site appears open with sporadic tree locations marked. Two further ponds are shown outside the site boundaries in the north-east and northwest. The Nutbrook canal runs along the northern boundary of the site, and a small ditch is shown running along the western site boundary entering the canal further to the north. The remaining surrounding land is primarily open fields.

1900 (1:2,500) – Within this edition the building in the west of the site had been demolished. The western most field boundary had also been removed along with the trees. The pond previously shown is now marked as a fish pond and smaller pond was now also shown in the far north-east corner.

1959 (1:2,500) - The north-eastern pond within the site has been infilled and all field boundaries have also been removed. No trees are mapped within the site from this point. No further significant changes appear on-site after this map edition.

2000 (aerial Photography) - the aerial photograph shows the site to broadly comprise two sections, north and south, with a remnant hedge line dividing them in part. Of note is a significant scar in the surfacing, running from the wester corner in a north-easterly direction. The scar continues off site to the north suggesting a possible service trench has recently been backfilled.

Sensitive Land Uses	0	-	Nitrate Vulnerable Zone	Y
	11	W	Areas of Adopted Green Belt	Y

Generally no significant sources of contamination have been identified from the environmental databases, although some off-site potential sources of land gas have been identified.

Two sensitive land uses have been identified which may lead to specific requirements within any planning applications.

Planning Application History 13

A review of the Erewash Borough Council website did not reveal any recent planning applications within the site boundaries.

Ground Gas Risk 14

The large infilled pond represents a possible ground gas risk which will require assessment and monitoring. In addition, the local mining legacy may also represent a risk from ground gases.

15 Coal Mining Risk Assessment

A Coal Mining Risk Assessment was produced for this site by BWB Consulting in November 2021. A summary of the findings within this report are presented below, although the reader is referred to the original document for full details.

Two seams are identified beneath the site, the Kilburn Seam (Coal) and the Sow/Honey Croft Seam (ironstone). Both seams have been indicated to underlie the site at depth of approximately 6m BGL.

The Coal Authority has indicated that there have been shallow coal workings in the north-east of the site and shallow ironstone working in the north and north-east. Additionally, there is one known disused mine shaft in the north-east of the site, and two shafts noted approximately 30m and 40m to the north of the site.

Given the shallow depth to the coal and ironstone seams, it is considered that there is a possibility that they have been extracted via unrecorded opencast mining techniques. It is possible that the on-site and off-site ponds are former extraction pits. If the site has not been subject to unrecorded opencast mining, it is considered that there is a risk of shall bell pit mine entries in the northern and central areas of the site.

Based on the published records held by the Coal Authority, BWB considers the risks associated with historic mining and ground stability at the site to be high.

16 **UXO** Risk Management

The possibility of unexploded ordnance (UXO) being encountered on a site falls within the category of a potentially significant risk and should be addressed as a legal duty under the Construction (Design and Management) Regulations by the Client as early as possible in a project.

The CIRIA publication C681 Ref [17] has been developed to provide a consistent framework for the management of potential risks posed by UXO during site investigation and groundwork phases of construction. The process adopts a tiered approach, divided into four distinct stages; Preliminary risk assessment, Detailed risk assessment, Risk mitigation and Implementation.

Whilst the agreed scope of work did not allow for either preliminary or detailed UXO risk assessment, a review of the Zetica online risk maps suggests the site to be in a 'Low Risk' area.

It should be noted that these maps have been reviewed for information purposes only and should not be perceived as part of a preliminary or detailed UXO risk assessment.

17 Site Walkover Survey

17.1 General Site Description and Boundaries

The site which extends for approximately 10 hectares comprises a grassed field enclosure. It is bound by the Nutbrook Canal to the north, Ilkeston Road to the east, Sowbrook Lane to the south-west and a fishing lake and wider farmland to the west/north-west.

The site is accessed from the south-east comer via a gate off the junction of Sowbrook Lane and Ilkeston Road. Pedestrian access is also available via a gravel track from the road in the east, along the northern boundary to the fishing lake adjacent to the north-west corner.

17.2 Topography

The site has been subject of a topographical survey, which is appended for reference. The site can be split into two halves, north and south, divided by the hedgerow which runs part way across the site.

The south-east corner, from the access gate, is relatively flat, but from around half way across, the land gently slopes down to the west. The hedge line which in parts marks the northern section of the site, leads into a relatively abrupt slope, which continues across the site in a westerly direction from the end of the hedge, tapering as it goes. The northern section of the site continues to rise slightly from the hedge, but then slopes away to the north-west and north towards the fishing lake and canal. A more abrupt slope is present on the eastern side of the site (north of the hedge), which is likely to be due to the former pond, as shown in this area on the historical maps.

17.3 Vegetation

The site has boundary hedging and vegetation on all sides, which includes species such as hawthorn, blackthorn and oak amongst others. There appears to be a remnant hedge line, approximately two thirds of the way down the eastern boundary. This hedge line extends approximately half way across the site, running in a broadly north-west direction.

The remainder of the site is grassed except in the north of the site there is a single semi-mature oak tree surrounded by hawthorn type scrub.

A tree survey will be required by a specialist contractor.

17.4 Buildings and Land Use on Site and Nearby

There are no buildings present on site, and currently appears unused. The historic maps inferred a structure in the west of the site at one time.

There is a fishing lake present adjacent to the site in the north (named Roughs Open Hole), and a second off-site to the east of Ilkeston Road (named Privates Pond). Nutbrook canal runs along the northern site boundary and appears to feed the second pond at least.

A small row of terrace housing is present just off the south-east corner of the site, at the junction of Sowbrook Lane, and Ilkeston Road. Also, to the south of Sowbrook Lane, approximately half way along the southern boundary, is an electrical sub-station.

There are a line of overhead power cables present in the south, which presumably run under Sowbrook Lane from the sub-station off-site to the south. The line of the cables generally follows the southern site boundary before exiting the site and turning in a northerly direction from the western corner.

Services drawings also show a gas and water main running across the site from the northern boundary heading in a south-westerly direction. Other services may also be present, although not yet identified.

Site Photographs 17.5

A series of photographs showing the site at the time of the walkover survey is included in Appendix D.

C PRELIMINARY SITE MODELS

Conceptual Engineering Geological Ground Model 18

From the desk study information and walkover undertaken at this site the following conceptual ground model has been formulated.

Data Source	Comments
Geology	The recorded geology of the site suggests it to be underlain by Alluvium
Geology	towards the north of the site over Pennine Middle Coal Measures and Wingfield Flags in the south. A lack of available local borehole records within the site means estimates on unit depths, or identification of possible unmapped superficial deposits, are not available.
	Based on the Coal Mining Risk Assessment and historical maps, it appears likely that the northern half of the site has been either mined, or potentially inpart, quarried. The southern half where the Wingfield Flags are mapped may have potentially remained untouched.
Former Site Use	Historical mapping shows the site has remained primarily an open field since at least 1881. Prior to 1959 there was a large pond within the north-east of the site and a structure in the west. The Coal mining risk assessment suggests that the surrounding and infilled lakes may be unmarked opencast mining pits. Any mining therefore appears to have taken place prior to the first OS mapping.
Groundwater	Both superficial and bedrock deposits are mapped aquifers, however, as there is limited access to borehole records, the likely depth of groundwater is unknown. At this stage groundwater should be expected during excavation, particularly in the northern areas where the alluvium is mapped.
Surface Water	The Nutbrook Canal is found immediately outside the northern boundary. Several ponds are also found towards the east and west of the site. Areas of the site have been marked at risk of surface water flooding.
Potential Geo-hazards	The site has been given a moderate risk of compressible ground from the environmental database. A high risk of collapsible and unstable ground is also given within the Coal Mining Risk assessment as a result of past mining activities. If the underlying strata recovered has a high clay fraction, it is also likely that
	the shrinkage and swelling potential will increase with it.

On the basis of the available information the geotechnical categorization for the proposed structure(s) is considered to fall within 3 – abnormal risks or exceptionally difficult ground or loading conditions; Eurocode 7 Ref [19].

19 Conceptual Site Model

In the context of this report, the conceptual model summarises the potential pollutant linkages identified for the site and forms the basis of the risk assessment. The preliminary model comprises the potential sources of contamination, receptors that could be harmed and exposure pathways identified from the desk study and walkover survey. These potential linkages form the basis upon which the investigation is designed and reported.

Potential Sources of Contamination 19.1

The site has a history of mining use and more recently agricultural land. It is located within a mainly agricultural/undeveloped area.

A few potentially contaminative uses have been identified, both on site and in the locality.

Potential contaminants associated with these uses have been compiled from DoE industry profiles and our experience of such sites.

19.1.1 On-Site Sources

Potential Source	Potential Contaminants	
Made ground (within backfilled ponds)	Metals, Asbestos, PAHs, Ground gas	
Historic building	Asbestos in building fabric.	
Mining activities	Ground gases.	
Agricultural	Pesticides and herbicides	

The backfilling of the ponds on site is considered the most likely source of contamination, depending on the nature of the material used. This may also represent a source of land gas.

19.1.2 Off-Site Sources

The site may be impacted by contamination migrating from beyond the site boundary. The following potential off-site sources have been identified.

Potential Source	Distance from Site Boundary	Direction	Potential Contaminants	Likely hazard to Site
Backfilled ponds	0	E	Metals, PAH, Ground gas	Low to moderate
Mining activities	0		Ground gases	Low to moderate.

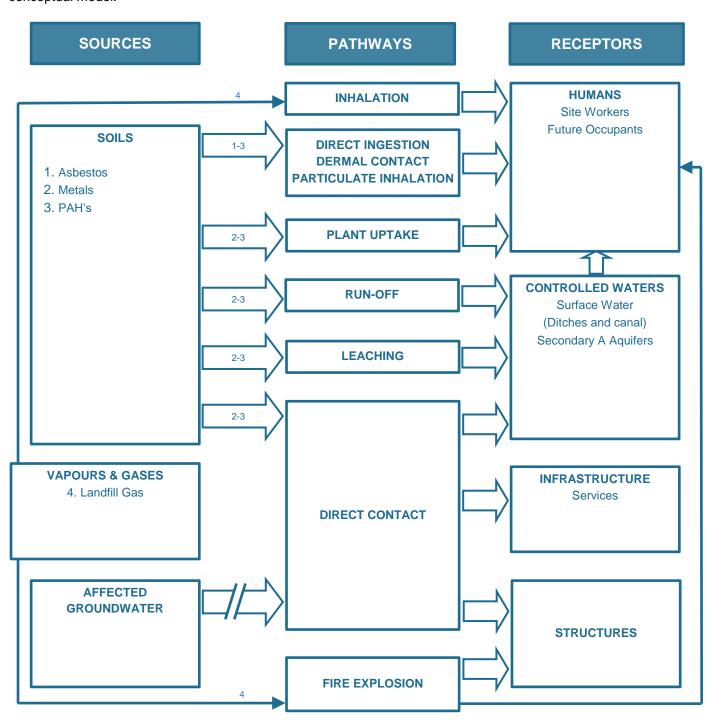

Similarly to the backfilled ponds on site, depending on the nature of the material used as backfill, the off-site ponds might represent a contamination risk, including a potential source of land gas.

19.2 Pollutant Linkages and Conceptual Site Model Summary

The following diagram shows the potential pollutant linkages identified for the site and summarises the preliminary conceptual model:

Denotes potential pollutant linkage not complete.

Conclusions and Recommendations 20

Historical mapping indicates that the site has remained largely unchanged since at least 1881, although mining in the north of the site prior to the time is considered likely. There is evidence of one building existing towards the west of the site, although this has since been demolished, and therefore localised areas of fill may be present here. Two ponds were also present on-site prior to being backfilled by 1959; again, these potentially represent a contamination risk, including land gas, depending on what material was used as backfill.

A history of mining activity both in the local area and within the site itself could represent a significant ground gas source that will likely require deep borehole investigations and ground gas monitoring to better assess the risk (as will the backfilled ponds).

The conceptual model is based upon both the historic and current uses of the site. Each of the pathways reviewed above is possibly significant and should be assessed by an intrusive investigation; at this stage, the overall risk of contamination is likely to be low to moderate, depending on the material used as backfill.

Risk of Soil Contamination 20.1

Given the site history, there is generally a low to moderate risk of significant contamination assumed at this Phase I stage, as some made ground in anticipated in places which might be impacted with the contaminants listed in the conceptual model. If the backfill material comprises site-won reworked natural soil, then the risk is likely to be low. A site-specific risk assessment will be required to assess the suitability of the topsoil and subsoil for re-use in any new residential development and to identify and assess any areas of fill.

Risk of Groundwater Contamination 20.2

The risk to groundwater is also considered to be low at this stage, although very little is known about the likely depth to groundwater. Again, the risk will also be impacted by how contaminated the site is.

The bedrock and superficial deposits are both Secondary A Aquifers. There is a ditch present on the western boundary, which appears to enter the canal to the north, together within the fishing lakes present to the north and east of the site, all of which represent sensitive receptors.

However, unless significant soil contamination is encountered, assessment of the groundwater is not considered necessary at this stage.

20.3 Risk from Ground Gases

A low to moderate potential gas risk has also been identified from the backfilled ponds and mining legacy on site and locally. As such, an assessment of land gas regime and gas risk assessment is considered necessary.

Published 1884 Source map scale - 1:10,560

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas; these maps were used to update the 1:10,560 maps. The published date given therefore is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas. In the late 1940's, a Provisional Edition was produced, which updated the 1:10,560 mapping from a number of sources. The maps appear unfinished - with all military camps and other strategic sites removed. These maps were initially overprinted with the National Grid. In 1970, the first 1:10,000 maps were produced using the Transverse Mercator Projection. The revision process continued until recently, with new editions appearing every 10 years or so for urban areas.

Source map scale - 1:10,000

These maps were produced by the Russian military during the Cold War between 1950 and 1997, and cover 103 towns and cities throughout the U.K. The maps are produced at 1:25,000, 1:10,000 and 1:5,000 scale, and show detailed land use, with colour-coded areas for development, green areas, and non-developed areas. Buildings are coloured black and important building uses (such as hospitals, post offices, factories etc.) are numbered, with a

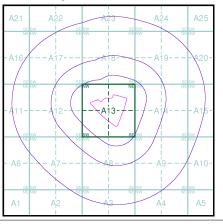

numbered key describing their use.

They were produced by the Russians for the benefit of navigation, as well as strategic military sites and transport hubs, for use if they were to have invaded the U.K. The detailed information provided indicates that the areas were surveyed using land-based personnel, on the ground, in the cities that

Derbyshire

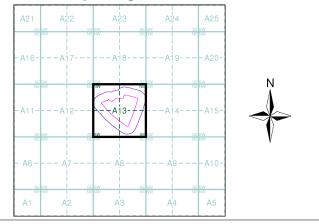

Published 1881 - 1885 Source map scale - 1:2,500

The historical maps shown were reproduced from maps predominantly held at the scale adopted for England, Wales and Scotland in the 1840's. In 1854 the 1:2,500 scale was adopted for mapping urban areas and by 1896 it covered the whole of what were considered to be the cultivated parts of Great Britain. The published date given below is often some years later than the surveyed date. Before 1938, all OS maps were based on the Cassini Projection, with independent surveys of a single county or group of counties, giving rise to significant inaccuracies in outlying areas.

Additional SIMs

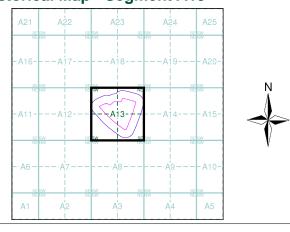

Published 1983 - 1988 Source map scale - 1:1,250

The SIM cards (Ordnance Survey's `Survey of Information on Microfilm') are further, minor editions of mapping which were produced and published in between the main editions as an area was updated. They date from 1947 to 1994, and contain detailed information on buildings, roads and land-use. These maps were produced at both 1:2,500 and 1:1,250 scales.

Large-Scale National Grid Data Published 1993 Source map scale - 1:1,250

'Large Scale National Grid Data' superseded SIM cards (Ordnance Survey's 'Survey of Information on Microfilm') in 1992, and continued to be produced until 1999. These maps were the fore-runners of digital mapping and so provide detailed information on houses and roads, but tend to show less topographic features such as vegetation. These maps were produced at both 1:2,500 and 1:1,250 scales.

Introduction

The Environment Act 1995 has made site sensitivity a key issue, as the legislation pays as much attention to the pathways by which contamination could spread,

and to the vulnerable targets of contamination, as it does the potential sources of contamination.

For this reason, Landmark's Site Sensitivity maps and Datasheet(s) place great emphasis on statutory data provided by the Environment Agency/Natural Resources Wales and the Scottish Environment Protection Agency; it also incorporates data from Natural England (and the Scottish and Welsh equivalents) and Local Authorities; and highlights hydrogeological features required by environmental and geotechnical consultants. It does not include any information concerning past uses of land. The datasheet is produced by querying the Landmark database to a distance defined by the client from a site boundary provided by the client. In this datasheet the National Grid References (NGRs) are rounded to the nearest 10m in accordance with Landmark's agreements with a number of Data Suppliers.

Geology 1:50,000 Maps

This report contains geological map extracts taken from the BGS Digital Geological map of Great Britain at 1:50,000 scale and is designed for users carrying out preliminary site assessments who require geological maps for the area around the site. This mapping may be more up to date than previously published paper maps.

The various geological layers - artificial and landslip deposits, superficial geology and solid (bedrock) geology are displayed in separate maps, but superimposed on the final 'Combined Surface Geology' map. All map legends feature on this page. Not all layers have complete nationwide coverage, so availability of data for relevant map sheets is indicated below.

Artificial Ground and Landslip

Artificial ground is a term used by BGS for those areas where the ground surface has been significantly modified by human activity. Information about previously developed ground is especially important, as it is often associated with potentially contaminated material, unpredictable engineering conditions and unstable ground.

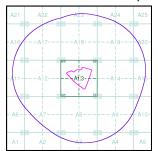

Artificial ground includes:

- Made ground man-made deposits such as embankments and spoil heaps on the natural ground surface.

 - Worked ground - areas where the ground has been cut away such as
- quarries and road cuttings.
- Infilled ground areas where the ground has been cut away then wholly or partially backfilled.
- Landscaped ground areas where the surface has been reshaped.
 Disturbed ground areas of ill-defined shallow or near surface mineral workings where it is impracticable to map made and worked ground

Mass movement (landslip) deposits on BGS geological maps are primarily superficial deposits that have moved down slope under gravity to form landslips. These affect bedrock, other superficial deposits and artificial ground. The dataset also includes foundered strata, where the ground has collapsed due to subsidence.

Page 2 of 5

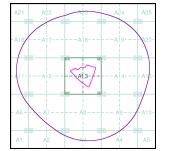

Superficial Geology

Superficial Deposits are the youngest geological deposits formed during the most recent period of geological time, the Quaternary, which extends back about 1.8 million years from the present.

They rest on older deposits or rocks referred to as Bedrock. This dataset contains Superficial deposits that are of natural origin and 'in place'. Other superficial strata may be held in the Mass Movement dataset where they have been moved, or in the Artificial Ground dataset where they are of man-made origin.

Most of these Superficial deposits are unconsolidated sediments such as gravel, sand, silt and clay, and onshore they form relatively thin, often discontinuous patches or larger spreads.

Page 3 of 5

Bedrock and Faults

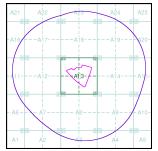

Bedrock geology is a term used for the main mass of rocks forming the Earth and are present everywhere, whether exposed at the surface in outcrops or concealed beneath superficial deposits or water.

The bedrock has formed over vast lengths of geological time ranging from ancient and highly altered rocks of the Proterozoic, some 2500 million years ago, or older, up to the relatively young Pliocene, 1.8 million years ago.

The bedrock geology includes many lithologies, often classified into three types based on origin: igneous, metamorphic and sedimentary.

The BGS Faults and Rock Segments dataset includes geological faults (e.g. normal, thrust), and thin beds mapped as lines (e.g. coal seam, gypsum bed). Some of these are linked to other particular 1:50,000 Geology datasets, for example, coal seams are part of the bedrock sequence, most faults and mineral veins primarily affect the bedrock but cut across the strata and post date its deposition.

Combined Surface Geology

The Combined Surface Geology map combines all the previous maps into one combined geological overview of your site.

Please consult the legends to the previous maps to interpret the Combined "Surface Geology" map.

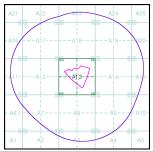

Additional Information

More information on 1:50,000 Geological mapping and explanations of rock classifications can be found on the BGS website. Using the LEX Codes in this report, further descriptions of rock types can be obtained by interrogating the 'BGS Lexicon of Named Rock Units'. This database can be accessed by following the 'Information and Data' link on the BGS website.
